Mallet, L.; Bussereau, F.; Jacquet, M.
Yeast (1995) 11:1195-1209
A 43:5 kb segment of yeast chromosome XIV, which contains
MFA2, MEP2, CAP/SRV2, NAM9, FKBI/FPRI/RBP1, MOM22 and CPT1,
predicts an adenosine deaminase gene and 14 new open
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the nucleotide sequence was submitted to the EMBL Data
Library, November 1994

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 27.188; Variance 37.530; scale 0.724 Statistics:

GENETICS 130:471-498(1992).

-!- FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBUNITS 1-3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE CATALYTIC SUBUNIT OF THE ENZYME COMPLEX. CO I IS THE CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER OF SUBUNIT 2 AND HEME A OF SUBUNIT 1 TO THE BIMETALLIC CENTER FORMED BY HEME A 3 AND COPPER B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4 ERALLILALICARINGE.

SUBCELIDIAR LOCATION: INTEGRAL MEMBRANE PROTEIN. MITOCHONDRIAL INNER MEMBRANE. CONTAINS 12 POTENTIAL TRANSKEMBRANE DOMAINS.

KROON P.A., BOSTEDOR K.G., KARKAS J.D.;
BIOCHEMISTRY 28:8129-8135(1999).
-!- FUNCTION: CATALYZES THE SEQUENTIAL CONDENSATION OF ISOPENTENYL
PYROPHOSPHATE WITH THE ALLYLIC PYROPHOSPHATES, DIMETHYLALLYL
PYROPHOSPHATE, AND THEN WITH THE RESULTRANT GERANYLEYROPHOSPHATE
-!- CATALYTIC ACTIVITY: DIMETHYLALLYL DIPHOSPHATE - ISOPENTENYL
DIPHOSPHATE = PYROPHOSPHATE + GERANYL DIPHOSPHATE
-!- CATALYTIC ACTIVITY: GERANYL DIPHOSPHATE + ISOPENTENYL
DIPHOSPHATE + TRANS, TRANS-FARNESYL DIPHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-JAN-1990 (REL. 13, CREATED)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 9.128; Variance 5.035; scale 1.813

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 7. Page 122, 183pp, Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-C19S in which the 19th Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption, e.g.

                                                                                            DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 36; Page 135-136; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-025s in which the 22nd Cys residue in the mature OCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 tgtgacaaatgtcctcctggtacctacctaaaacaaccactgtacagcaaagtggaagacc 180

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-C20S in which the 20th Cys residue in the mature ocif protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto eation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore
                                                                                                                                                                                                                                               1080

DNA ehcoding osteoclastogenesis inhibitory factor protein - useful
for bone resorption control, esp. treatment of osteoporosis
Claim 33: Page 134-135; 183pp; Japanese.

This sequence encodes a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence encodes OCIF-C1S in which the 21st Cys residue in the mature
CC for protein is substituted by Ser. The OCIF of the invention has a
molecular weight by SDS-PAGE of 60 kD under reducing conditions and
120 kB under non-reducing conditions. The protein is adsorbed onto
cation-exchangers or heparin and its activity is lowered after 10 mins
cat 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 50 deg.C. Ocif is useful in the control of bone resorption and therefore
                                                                                                                          gtcactcagagtctaaagaagaccatcaggttccttcacagcttcacaatgtacaaattg 1140

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 60; Page 143-144; 183pp. Japanese.

Claim 60; Page 143-144; 183pp. Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CL in which amino acids 379-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gtgtgcgcccttgccctgaccactactacacagacagctggcacaccagtgacgagtgt 240

The Priblic Kayaye.

The Annocoling osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis olden in the following sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CBst in which Gla371 is substituted with Leu and amino acids 373-380 of the mature protein have been deeleted. These anion of changes have been caused by the introduction of a restriction of the older reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 50 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              caggaaacgtttcctccaaagtaccttcattatgacgaagaaacctctcatcagctgttg 120

New human tumour necrosis factor receptor - used to develop prods.

To treating e.g. tumours, infection, auto:immune disease, graft rejection, cytotoxicity or inflammation

Claim 1; Fig 1; 59pp: English.

The receptor binds to TNF, and in particular, TNF-beta.

The receptor and for ligands for antegonists and agonists of the receptor and for ligands for the receptor. Such agonists of the receptor and for ligands for the receptor. Such agonists and differentiation, to mediate the immune response and anti-viral response, to requiate growth and provide resistance to certain infections. The antagonists may be used therapeutically, to treat autoimmune diseases, inflammation, septic shock, to inhibit graft.

Contact of the receptor and for prevent apoptosis.

for bone resorption control, esp. treatment of osteoporosis
Claim 42, Page 137-138; 183pp; Japanese.
This sequence encodes a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence encodes OCIF-DCR1 in which amino acids 2-42 of the mature
protein have been deleted. The OCIF of the invention has a molecular
whight by SDS-RAGE of 60 kD under reducing conditions and 120 kD under
non-reducing conditions. The protein is adsorbed onto cation-exchangers
or heparin and its activity is lowered after 10 mins at 70 deg.C or 30
in the control of bone resorption and therefore in the treatment and
prevention of disorders of bone resorption, e.g. osteoporosis.
